Summary of What we Learned as a Team:

This assignment give us an opportunity to practice working on a team. We had all worked on teams in classes such as 6.005 but most of the team work revolved around the mechanics of sharing a Git repository and resolving conflicts. This project was different in that it actually enabled us to develop important habits of working collaboratively with others. In phase 1 for example, we had to each come up with a draft of our application's purposes, concepts and proposed data model. As we integrated our different ideas and designs to form the final design document, each team member had to leave some of their ideas behind in favor of those of another team member which were better suited for the application we were trying to build. Coming up with a something that everyone agrees on is probably that hardest part of working in a team and I think we did a good job of making sure everyone's ideas were integrated into the final solution in some part.
